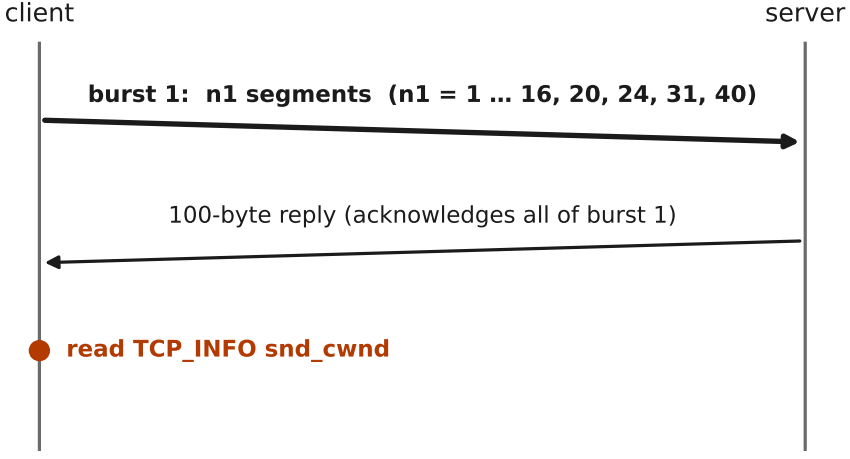
A Window rule (plain TCP, 13 configurations)

tcp_flight; one factor changed at a time; 20 repetitions; ~25 min



What is measured

the congestion window the kernel really has after n1 segments

RTT 5/30/100 ms · 10/100/1000 Mbit/s · MTU 1280/1500/9000

initcwnd 4/10/20 · delayed ACK · Cubic · timestamps · offload

Compared with

grow_cwnd(icw, n1, slack), slack = 0 … 4: share of exact matches

optional: cwnd at every ACK (tcp_probe tracepoint, --trace)
