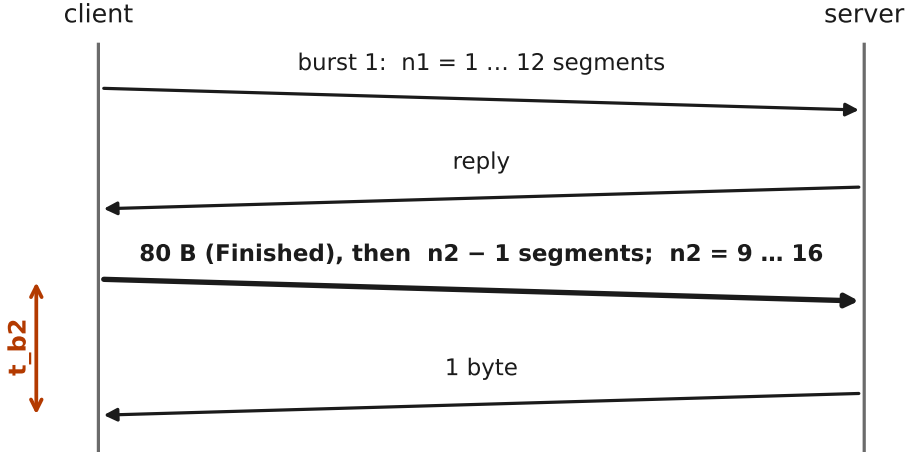
B Cost of a second flight (plain TCP, 6 configurations)

tcp_flight --split; base, delayed ACK, offload, Cubic, initcwnd 4 and 20; 15 repetitions; ~1 h



What is measured

time t_b2: first write of the second flight to its reply

(each extra round trip is a step of one RTT)

Compared with

model time with the window the kernel really had (stage A)

model time with the window each slack = 0 … 4 predicts:

which slack explains the extra round trips
